

Project Initialization and Planning Phase

Date	26 June 2026
Team ID	XXXXXX
Project Name	Rising waters
Maximum Marks	3 Marks

Define Problem Statements (Customer Problem Statement Template):

Create a problem statement to understand your customer's point of view. The Customer Problem Statement template helps you focus on what matters to create experiences people will love. A well-articulated customer problem statement allows you and your team to find the ideal solution for your customers' challenges. Throughout the process, you'll also be able to empathize with your customers, which helps you better understand how they perceive your product or service.

Example:

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A regional disaster management officer, emergency response coordinator, and government official responsible for public safety in flood-prone districts.	Predict flood risks accurately, issue timely evacuation warnings, deploy rescue teams efficiently, allocate emergency resources, and minimize the loss of lives.	Existing flood forecasting systems are slow, depend heavily on manual analysis, provide delayed warnings, and often fail to deliver accurate district-level flood predictions in real time.	Traditional approaches cannot effectively combine historical flood records, live weather conditions, rainfall intensity, humidity, river water levels, and machine learning algorithms to generate reliable, location-specific flood risk predictions and automated alerts.	Anxious, overwhelmed, and under constant pressure because delayed or inaccurate predictions can result in loss of human lives, severe property damage.

PS -2	A regional disaster management officer.	Predict flood risks early and coordinate emergency response efficiently.	Existing forecasting systems provide delayed and generalized predictions.	They rely on manual analysis and cannot process real-time weather and historical flood data together.	Anxious, overwhelmed, and responsible for protecting thousands of lives.
PS-3	A district collector responsible for disaster preparedness.	Coordinate evacuation plans and distribute emergency resources before flooding occurs.	Flood risk information is scattered across multiple departments and arrives too late.	There is no centralized platform providing accurate, real-time flood intelligence.	Stressed because delayed decisions can increase casualties and property damage.
PS-4	A rescue team coordinator.	Deploy rescue boats, medical teams, and relief supplies to the most affected areas.	It is difficult to identify which regions are at the highest risk in real time.	Existing systems lack predictive analytics and live visual dashboards.	Frustrated because delayed deployment can cost lives.
PS-5	A meteorologist working in a weather forecasting department.	Improve the accuracy of flood predictions using historical and live weather data.	Conventional forecasting models cannot efficiently analyze large, multidimensional datasets.	They do not leverage advanced machine learning algorithms for prediction.	Concerned that inaccurate forecasts reduce public trust.
PS-6	A local government official.	Minimize the economic impact of floods and protect public infrastructure.	Flood response planning is mostly reactive instead of proactive.	There is no intelligent decision-support system for predicting flood severity.	Pressured to reduce losses with limited time and resources.
