Maximum Marks	4 Marks

Person - Rajesh Kumar (Regional Disaster Relief Coordinator & Emergency Responder)

SAYS	THINKS
"By the time the weather report updates, the roads are already flooded and we can't get trucks through." "I need a single, reliable number or risk level for each district so I can deploy our rescue boats effectively." "We spent half our budget moving supplies to District A yesterday, but District B was the one that actually got hit."	I hope this 96.55% accuracy claim holds up under real monsoon conditions; false alarms will make the public ignore our future warnings. If I order an evacuation too late, people's lives are on the line. If I order it too early for no reason, I disrupt thousands of livelihoods. This data is too complicated. I wish there was an intuitive, color-coded map instead of these massive spreadsheets of rainfall decimals

DOES	FEELS
Manually cross-references outdated historical rainfall logs with live, scattered weather channel reports. Calls local district heads one by one during heavy storms to verify actual cloud visibility and ground conditions. Scrambles to allocate limited rescue teams, trucks, and food packets across multiple vulnerable zones simultaneously based on guesswork.	Overwhelmed by the sheer volume of chaotic, unorganized data coming in during critical weather events. Anxious and Stressed about the massive responsibility of predicting precise evacuation windows hours in advance. Frustrated by the recurring gaps in conventional systems that consistently leave his teams on the defensive rather than prepared.
