

Customer Journey Map

Date	27 June 2026
Team ID	xxxxxxx
Project Name	Rising Waters
Maximum Marks	2 Marks

Phase of Journey	Stage 1: Threat Monitoring & Assessment	Stage 2: Verification & Critical Alerting	Stage 3: Dynamic Resource Allocation
Actions	Logs into the Flask dashboard daily. Monitors regional overview maps. Filters districts by baseline seasonal rainfall patterns.	Inputs real-time rainfall data manually. Reviews the 96.55% XGBoost high-probability classification. Selects the high-risk region to view details.	Maps out optimal emergency travel corridors. Tracks live asset distribution fleets. Directs rescue boats and supplies to high-priority zones.
Touch Point	Flask Application User Authentication Portal. Main Map Dashboard Leaflet.js View.	Input Form Fields (Rainfall, Cloud Visibility). System Predictive Results Banner.	GIS Dynamic Path Matrix Overlay. Real-Time Resource Inventory Ticker. Post-Event Logging Console.
Customer Thought	"Is there any heavy weather forming that isn't caught by conventional models?" "I hope our data feeds are sync'd."	"Can I confidently execute a localized evacuation advisory based on this ML prediction?" "I need to send the warning now."	"Which routes remain completely unflooded for delivery trucks?" "Did the ground rescue teams get the warning?"

Process Ownership:	Member 2 (Data Engineer) & Member 3 (UI/UX) to maintain stable, live API ingestion and map visibility.	Member 1 (ML Engineer) & Member 5 (Backend Integration) to process predictions and trigger webhooks.	Member 4 (Cloud DevOps) to scale backend compute power on Render as concurrent coordination traffic spikes.
Opportunities:	Implement automated push alerts for incoming API threshold exceptions. Cache static geographic mapping boundaries locally to cut reload speeds.	Incorporate predictive confidence intervals alongside the output metrics. Add a 10-second "Undo/Cancel Alert" buffer step to prevent user click errors.	Integrate a live fleet GPS locator map API onto the tracking UI. Build a single-button archive engine to instantly export deployment files for debriefs.
